

Oral Cancer Screening Consent Form

We at Princeton Dental are very concerned about oral cancer and conduct screening examinations on every patient. Traditionally dentists and hygienists have done oral cancer screenings with the naked eye. Recently however, a new technology, The OrallD has received FDA approval to help pinpoint suspicious tissue at earlier stages before they may become life threatening.

The mortality rate for oral cancer has not changed significantly in 30 years. Some 63% of oral cancers are found at Stage III and IV, which have a less than 50% survival rate. However, early discovery has an 80% to 90% survival rate. A two-minute oral exam with OrallD could literally save a life and it's why Princeton Dental has made this technology part of our routine exams.

There is **NO FEE** for OrallD and in addition to our traditional visual oral cancer screening, will add only a few minutes to the entire exam. As part of our standard of care and because we care about you, we strongly recommend that you choose this additional screening procedure.

Please print your name and sign below to authorize the office to perform the OrallD examination.
